### An Intelligent System to Convert Bangla Sign Language into Speech

This system will help the vocally impaired people who use sign language to express their feelings. But normal people don't know sign language. This device converts sign language into speech, so that normal people can easily understand the words that the vocally impaired want to say. In Bangla language, with changing the tense, the pronunciation of verbs also changes. The pronunciation of verbs again changes according to how you are addressing someone. Those ambiguities are also solved with this device.

Arduino, Python, MySQL, Sensors, Machine Learning, Natural Language Processing.
